

Appian AI Real-World Use Cases

2025

AI Production Use Cases

Personalized Advisory Services

Generative AI assistance

University of South Florida (USF) academic advisors use the records chat component of Appian AI Copilot to give students faster, more personalized support. The conversational generative AI assistant saves advisors 15 minutes in prep and wrap up for each 30-minute meeting. Records chat can:

- Answer advisors' questions about student case history data
- Suggest agendas for student meetings
- Create personalized action plans for students
- Draft follow-up messages to students

Appian data fabric gives records chat context to power its outputs. USF deployed the AI assistant in under two months to 180 advisors serving up to 50k students per year.

UP TO

12,500 hours
saved annually

Eliminated manual meeting prep for
50% more time
connecting with students

"Drafting communications to students with follow-up actions is much easier"
(USF Advising Community)

Faster Patient Onboarding

Entity extraction from unstructured documents

Acclaim Autism reduced patient intake time by an average of 83% with Appian AI. Before Appian, the process took up to six months. It required manually processing dense, unstructured medical documents, leading to errors and costly rework.

Appian AI reduced wait times for patient intake to less than one month by:

- Automatically extracting data from unstructured documents
- Verifying data with 95% accuracy
- Ensuring records meet HIPAA and other privacy standards

With Appian, Acclaim patients now wait as few as 10 days to receive care.

95%
accuracy in data
extraction

UP TO
83%
shorter wait times

“The document extraction software empowers Acclaim Autism’s intake team to spend more time speaking with caregivers and less time with the tedium of document validation”

William Oswald, Information Technology Manager at Acclaim Autism

Award Management Optimization

Procurement chatbot leveraging AI plug-ins

The **Texas Department of Public Safety** deployed Appian AI to optimize awards management, a highly regulated process involving hundreds of millions of dollars in contracts every year.

- AI understands thousands of regulatory and procedural policies.
- Procurement staff can ask AI questions in real time and get accurate answers.

Appian AI is embedded in the customer's workflow, doing work and making the customer's data more usable than before.

Real-time insights
on a knowledge base with
2,000+ pages

Increased
speed and accuracy
for procurements

Streamlining Invoice Processing with AI

Document classification and extraction AI Skills

At **Century Fire Protection**, 11 people handled accounts payable (AP), processing over 10,000 invoices and order acknowledgements per month. The manual process was costly and error-prone.

Appian's Customer Success team built an AP management application using AI Skills for the following:

- Classifies documents based on the vendor's priority
- Extracts document information to compare accounting information against data available in the customers' accounting system
- Mixed autonomy involves the user in resolving discrepancies and performing system updates

Expected savings of
8,000 hours/year (4 FTE)
by reducing manual processing

Discounts of up to
500,000 USD/year
for more timely payments

News Summarization for Quick Insights

Prompt builder generates AI-based summaries

A global energy technology company built a News Content Management application on Appian, leveraging AI.

- Users can access summaries of news articles to quickly understand relevant industry updates and streamline their work.
- The prompt builder AI Skill offers structured and impactful generative AI.

The organization's data science team was already working on focused AI efforts, but article summarization was out of their scope. Appian made this process easy to implement, enabling them to realize the value of Process AI.

30 minutes
to stand up the initial POC

AI was **simple and fast to implement**
into their workflow

Faster Document Processing

Entity extraction from unstructured documents

A mortgage company used Appian AI to process post-closing documents ~70% faster with over 95% accuracy.

Before Appian, the company managed post-closing audits manually using a spreadsheet. They had a 45-day audit backlog.

By adding AI to the process, the company achieved:

- Automatically extract 100+ data fields across unstructured documents.
- Reduced processing time from ~50 to 15 minutes per audit.
- Average accuracy rate of ~95+% for data extraction

~70%
reduction
in audit time

Reduced audit
backlog from
45 days to
real-time

Better Underwriting Accuracy

Document classification and extraction

A leading insurance group is using Appian AI for faster, more accurate underwriting. The company's underwriters were manually processing quotes from hundreds of brokers with only 65% accuracy. They received quotes in many different formats, often handwritten. With Appian, the insurer:

- Developed a document ingestion solution in 6 weeks
- Classifies documents and extracts data with machine learning and generative AI
- Processes documents with 95% accuracy

The insurer expects the Appian AI document ingestion solution will increase their annual quote to bind rate. And they estimate that more productive underwriting will drive revenue growth of ~\$400,000/month.

~30% higher accuracy
in document processing

~\$400,000 USD
expected revenue growth
per month

Smarter Email Ingestion

Email processing and data extraction

A leading privately owned real estate firm uses Appian AI to improve investor relations with faster email processing.

The fund management team had been processing incoming investor emails manually, but the firm's rapid growth made this approach unsustainable. They built a solution on Appian to make the email ingestion process more efficient. The Appian AI solution can:

- Classify 10+ email types for routing and processing
- Connect emails with ongoing cases or help identify new cases
- Extract fund data from emails and match it with a list of funds
- Write summaries of email threads

In less than 2 months, the firm used AI in their process over 10,000 times. Appian gives them agility to go from email to action in less time for better investor relations.

AI executions in less than
2 months

Improved investor relations
agility & efficiency

Touchless Order Processing

Email processing and data extraction

A global healthcare technology leader used Appian AI to automate order intake for 600+ customers. They built an app that uses AI for order routing to increase straight-through processing, or “touchless orders.”

Their AI solution for order intake can:

- Process up to 2,000 emails per day
- Extract order data from PDFs and emails of all formats
- Classify emails as orders or inquiries
- Categorize and prioritize inquiries based on sentiment

Appian is helping this company move toward their goal of exception-based operations, where humans only handle issues and AI takes care of the rest.

AI processes up to
2,000 emails/day

~90% accuracy
of data extraction

Increased Efficiency in Email Handling

Email classification

A financial services firm inundated with hundreds of emails per day required a team of 15–20 people to classify and route these emails to the right teams.

They turned to Appian to automate and streamline email handling by:

- Building a custom-trained AI model to classify and categorize incoming email
- Using business logic to further process the emails

Next, they plan to use Appian's prompt builder AI Skill to extract key information from emails, further streamlining the process.

**100–150
emails/day**
automatically classified

Team's workload was
**reduced
significantly**

Evolving Invoice Processing with AI

Document extraction

One of Spain's largest construction companies wanted to digitize their invoice processing operations. They handled hundreds of millions of euros for major projects like bridges, tunnels, and highways.

The Appian Customer Success team helped build an AI-driven invoice management application to process, validate, and assign invoices. This involves:

- Scanning PDF invoices and uploading them to the platform
- Extracting key data from invoices with a variety of field types
- Pulling in the user to review and complete any information the AI cannot handle

20+ data fields
automatically extracted
from invoices

15,000+
extractions performed
in the first two months

Automating Document Flows

Document classification and extraction AI Skills

One of the largest banks in LATAM used Appian and its AI skills to automate document processing for invoices, financial agreements, certificates, etc. They worked with the Appian Customer Success team to build a solution combining intelligent automation, process digitization, and low-code development.

In just 10 weeks, they build a 50-user solution that:

- Classifies documents into different categories
- Extracts relevant information from each document
- Applies business rules to the extracted data

Previously outsourced doc
processing can now be
handled in-house

From idea to a 50-user
MVP in just
10 weeks

AI Routing of Accounts Payable Files

Document and email classification AI Skills

A global renewable energy company used Appian's document and email classification AI Skills to automatically route accounts payable files, saving significant time by:

- Classifying incoming emails as spam or not spam
- Classifying attachments as invoices or non-invoices, then sorting them into categories like ACH requests, check requests, or donation requests
- Routing to the correct process flows based on classification
- Using Appian RPA to send EML files as an attachment, supplementing the AI Skills functionality

5,000+ files
automatically routed
per month

95%+ accuracy
achieved in
ML models training

AI in Action for Case Categorization

Email classification AI Skill

A major Australian financial services firm had a manual triage process for case creation failure messages. They used Appian and its email classification AI Skill to automate this process and speed up issue resolution time by:

- Opening and classifying each email
- Identifying the reason for the failure message
- Using Appian to then route the information to the appropriate team

This process resulted in the team bypassing a significant amount of manual review, allowing them to act much faster on resolving case creation failures.

Using 220 examples across 5 failure types, the AI Skill was
trained in minutes

98% accuracy
achieved in the
model training

AI-Powered Invoice Processing Application

Document extraction for improved invoice handling

A world-leading distributor of energy products deployed an AI-powered invoice processing application that helps them:

- Review, submit, and track invoices from fuel and non-fuel suppliers in a more efficient way
- Automatically pull key information like invoice numbers, dates, or amounts from thousands of invoices using the document extraction AI skill

This saves time for their accounting team by reducing manual data entry and supplier invoice processing.

In one year, they achieved
28,000+
document extraction activities

They decided to
expand the use case
to additional geographies

Boosting Case Management with AI

Email Classification AI Skill + Case Management

A major wealth management group processed customer requests manually via 10–15 people working in a shared email inbox, managing the workload via chat and using Excel for reporting. They leveraged Appian's email classification in their case management application to automate the process by:

- Automatically routing customer support cases
- Classifying cases and emails into 15 different categories

Triaging, responding, and reporting on incoming cases is now more efficient and manual processing is decreased.

200 cases/week
automatically routed

92% accuracy
in the classification
model training

Automating Invoice Processing

Document Extraction meets RPA to automate AR

A leading provider of renewable energy uses Appian document extraction and RPA in production to process invoices.

- Each month, an Appian RPA bot accesses 22 vendor portals, downloads invoices, and uploads them to Appian for document extraction.
- By using key-value pair and positional extraction, the company achieves 100% straight-through processing, eliminating the need for human intervention.

This provided a fantastic opportunity to showcase Appian's complete suite of automation tools on a project with c-level visibility.

AI and RPA combined to allow
100%
straight-through
processing

Increased processing
speed and accuracy
for invoice data entry
and validation

Streamlined Customer Onboarding

Automated data extraction to confirm customer identity

A major gas station and convenience store chain works with an Appian partner to streamline monthly onboarding of hundreds of customers using the document extraction AI Skill.

In 2022, the company launched a virtual payment product requiring customers to upload six documents to verify their identity during onboarding.

- Before Appian, employees manually entered data into the company's ERP system. This slow process led to a backlog of more than 8,000 applications.
- Now a digital onboarding process assigns electronic wallets and automatic payment process authorization by leveraging Appian document extraction.

This has reduced the backlog load in just the first month alone.

**Time to onboard a customer
reduced from
2 weeks to 1 day**

**12 data entry FTEs
refocused to more
valuable tasks**

Dynamically Generating Insurance Documents

Document classification and document extraction AI Skills

A major pension fund manager had a manual document processing system. The company sends complex policy forms on a daily basis for customers to complete. Each form is dynamically composed according to 15 – 20 different conditions.

They took part in Appian's AI Kick Start program to add Appian's document classification and extraction AI Skills to their claims workflow. They automated the processing of customer policy letters by:

- Training an accurate entity extraction model using just 30 document examples
- Extracting critical information these documents
- Routing the data to a reconciliation task to ensure results are accurate and the record is updated

Expected volume of
3,000 docs/month

75% recall
achieved with the
first training round

AI Pilots

Reducing Medical Report Processing Time

Entity extraction from unstructured documents

A healthcare provider committed to offering the highest standard of care needed to reduce the time it took to process post-appointment medical reports. Each report must undergo rigorous quality controls, checking each against a checklist business rules on what each report should contain. They used Appian and its prompt builder AI Skill to:

- Extract data for 61 fields across reports
- Check these fields using business rules to speed up quality checks
- Greatly reduce processing time (from 10 minutes per report to less than 3)

Achieved
83% accuracy
in AI pre-work

Reduced processing times from
10 mins to under 3 min
per report

Speeding Up Admissions Denial Processing

Entity extraction from unstructured documents

A healthcare company receives more than 40 different types of complex patient admission denial forms—each at 8–10 pages per document and including complex procedural verbiage and legal disclosures. Automating this could lead to potential overall savings of \$8M.

They built a pilot using the prompt builder AI Skill that extracts key information from denial letters, including:

- The reason for denying the claim
- The basis and underlying policies for the denial
- Details about the appeal process

Pertinent details
extracted in seconds,
rather than minutes

Reduces the **heavy task**
of searching through
tons of information

Saving 2,000 Hours Processing Intricate Documents

Entity extraction from unstructured documents

A global pharmaceutical company needed to process certificates that demonstrated that crop shipments were free of any disease or defect, ensuring safety. These documents were intricate, difficult to interpret, and time-consuming to handle manually.

They used Appian and the prompt builder AI Skill to:

- Read the documents and extract a list of diseases
- Match these values automatically to a pre-built source of truth
- Route exceptions and edge cases to experts for review

Achieved
99% accuracy
in the AI pilot

Estimated savings of
2,000 hours
annually

Regulatory Intelligence for Policy Monitoring

Analysis and comparison of domain-specific content

A pharmaceutical company developed an application to track and update regulatory information as global policy changes. The app saves employees from manually reviewing lengthy documents and past regulations to map regulatory changes.

They launched a pilot using the prompt builder AI Skill to automate the task by:

- Passing regulatory topics and documents to the AI model
- Having the AI identify changes related to the specified topics, with supporting evidence

Gen AI complements an existing application for **enhanced automation**

The AI model effectively interprets complex **medical terminology**

Automating Drug Document Creation

Entity extraction from unstructured documents

A pharmaceutical company wanted to extract technical drug information from documents and put it into an easy-to-read PDF. They used Appian and its prompt builder AI skill to:

- Extract data from technical, drug-related documents
- Use RPA to pull additional information from an external government database
- Populate the extracted data into a target PDF document generated in Appian

Improved data-based
decision-making
for analysts

Achieved end-to-end
automation by **pairing**
RPA with AI

Extract Data from Scanned Prescriptions

Entity extraction from unstructured documents

A company managing expensive and highly specialized drugs for seniors needed to extract data from scanned prescriptions. The process was already 66% automated, but they wanted to automate more.

They used Appian's prompt builder AI Skill to extract key data and show it to users for verification, including:

- Drug name and manufacturer
- Quantity
- Strength
- Free-form directions

Gen AI complements IDP for
up to 90%
automated extraction

Sensitive medical data
remains confidential
using private AI

Processing Complex Patient Medical Histories

Entity extraction and summarization from unstructured documents

An insurer's underwriters processed over 2 million pages of patient medical histories annually, each ranging from 20 to 400+ pages, for use in underwriting evaluations. Processing took 60 minutes per document and was fraught with inefficiencies, errors, and high costs. They built a generative AI proof of concept to:

- Split documents and feed them into Appian's prompt builder AI Skill to extract the information
- Combine the results to present all fields in one place

**Human involvement
reduced**
to verification only

AI helped improve quality of
underwriting decisions
and claims handling

Extracting Insurance Policy Information

Unstructured email extraction

An insurance company was inundated with hundreds of email requests per day from local brokers. They needed to route emails based on data such as policy code or holder ID, which were often located in different locations and formats in each email.

They built a proof of concept in hours and tested it on 100+ emails to:

- Easily identify key data
- Process emails across languages—including Spanish

The customer now plans to scale this solution to automate policy information extraction.

Efficiently process
high volumes
of unstructured emails

Fully train AI using
minimal example
data

Extracting PII from Scanned, Handwritten Docs

Entity extraction from unstructured documents

A financial services company managed the complex process of transferring funds to heirs, where accuracy was critical to avoid missed transfers or tax errors. They previously used OCR for PII extraction but sought a better solution. In two weeks, they built a pilot using Appian and our generative AI Prompt Build skill to:

- Extract data from unstructured, low-quality document scans
- Translate documents into English
- Process key data from various identification formats, handwritten forms, and semantic descriptions

**3x expected
reduction** in data
extraction times

Leverages the powerful
confluence of AI
and traditional orchestration

Extracting Information from Bank Trade Emails

Unstructured email extraction

A financial services company receives over 1,000 trade-related emails monthly which include information that needed to be extracted for further processing. Manually extracting data from the emails caused delays, errors, and inefficiencies, and RPA solutions proved too inflexible. In just three weeks, they built a proof of concept with Appian's prompt builder AI Skill that:

- Streamlined entity tagging
- Automatically extracted 40+ data fields from emails
- Created an intuitive UI for human oversight

4x reduction in
extraction times

95% accuracy
achieved during pilot

Interpreting Bond Certificates

Entity extraction from unstructured documents

A bank sought to automate processing for large volumes of complex, unstructured bond holder certification documents that outlined rules and procedures for further processing. Accuracy was critical, because errors could lead to costly reprocessing. They used Appian to develop a proof of concept that:

- Uses gen AI to extract key information
- Establishes business rules to route cases
- Fully automates the manual data collection process

From fully manual to
highly automated
data collection work

Potential to scale
to new use cases beyond
bonds certificates

Comparing NDAs for Risk Remediation

Document comparison

A financial company's legal team needed to review and compare NDAs to ensure identified risks were addressed. Manual processing was costly, error-prone, and time-consuming, diverting legal experts from higher-value tasks.

Using Appian and its prompt builder AI Skill, they developed a solution that:

- Reads and understands multiple NDAs
- Identifies differences between files
- Assesses if risks are adequately handled
- Allows legal experts to review for accuracy

Manual work reduction with
**Speed and
Automation**

Provides
insights & reasoning
into the differences found

Freeing Up Legal Experts from Doc Processing

Entity extraction from unstructured documents

A large telecom provider's legal department handled vast volumes of unstructured legal documents manually, incurring high costs. They launched a gen AI pilot with Appian's prompt builder AI Skill to:

- Extract and analyze data from text-heavy legal documents
- Seamlessly integrate AI into existing manual processes
- Use Appian's private AI to overcome internal restrictions on third-party AI

The team also appreciated the simplicity of prompt builder's setup and use.

Key data extracted from
complex, multi-page
documents

AI seamlessly
added to manual
document flows

Court Files Management Leveraging AI

Entity extraction from unstructured documents

A leading consulting firm built an Appian interface to help a legal team access relevant court information to interpret judgments and legal documents. Using the Appian Platform and its prompt builder AI Skill, they built a pilot that:

- Extracts entities and data from unstructured court documents
- Integrates AI into existing Appian workflows

Additionally, they recognized how easy prompt builder was to use, enabling them to build the feature in just two weeks.

Automated
a time-consuming task

Built the feature in
just 2 weeks
